

MEMENTO PATTERN

Behavioural Design Pattern

Undo/Redo Problem Statement

Think of a text editor like **MS Word** or **Google Docs**.

When you **type**, **delete**, or **format** text, the editor saves a "snapshot" of what the document looks like after each action.

This way, when you press **Ctrl+Z (undo)**, the editor can bring back the **previous** version of your document

Memento Pattern Structure

Originator: This is the main object whose data you want to save and bring back later. Think of it as the **TextEditor** that holds your content.

Memento: This acts like a snapshot or save point that captures the originator's data at a specific moment. **TextMemento Class**

Caretaker: This is the manager that keeps all the snapshots safe and organized. It doesn't change the snapshots, just stores them and gives them back when you need them. Think of it as the **History Class**.
